

WEEK 10

1. PREPARATION FOR ASSIGNMENT

If, and *only if* you can truthfully assert the truthfulness of each comprehension and memory self-check statement below are you ready to start the tasks for the week.

1.1. Reading Comprehension Self-Check.

- I know and understand the difference between an array, a vector, a stack, a queue, a deque, a set, a list, a tree, a BST, and a map.
- I know and understand what a key is and what a value is and how they are related with regards to a map.
- I know and understand why map doesn't guarantee the order of the stored values.
- I understand why the insert method of map has two parameters, and I know what they are.
- I understand why accessing the data stored in a map only requires the key.

1.2. **Memory Self-Check.** I can, and have, explained to someone who is not a student in the Computer Science and Electrical Engineering, Computer Information Technology, or Mathematics departments in a way that they understand what a map is and why it is important.

2. WEEK 10 TEAM TASKS

Note: All review tasks come from the book.

2.1. Review Task 10.4.

2.2. Review Task 10.5.

2.3. **Creation Tasks.** Write code matching the UML class diagrams on page 275 of the textbook so that your implementation passes the assertions in the main.cpp for this data structure.

2.4. **Pondering Task.** What different kinds of uses can you find or brainstorm for this data structure?

2.5. **Pondering Task.** What changes to the API for this data structure can you brainstorm that might make it easier to use? What would be the design for one of your changes?

Date: January 7, 2020.

2.6. **Pondering Task.** Brainstorm some coding tasks/situations or types of data where using this data structure would make organizing, accessing, inserting, or updating the data difficult.

2.7. **Pondering Task.** Brainstorm about and record why there are differences between the API for this data structure and the API for this data structure in another language of your choice. Consider the strengths, weaknesses, similarities, and differences between these API's for the data structure.
